

*FieldWorker*TM

FieldWorker Enterprise

FieldWorker Enterprise combines the easy-to-use, rapidly deployed FieldWorker Standalone with the powerful and robust FieldWorker Synchronization Server. Now, all of your workers in the field can move critical data from where they find it to where you need it. Using any Internet connection, you can exchange data using the net change protocol to reduce connection time and expense. FieldWorker Enterprise enables you to update mobile data collection applications remotely, eliminating the necessity - and the downtime - of bringing workers and devices in from the field.

Two-Way Communication

With FieldWorker Enterprise, management of your FieldWorker mobile applications is controlled from a centralized location. You control which application is deployed to which workers. If you remove or add an application assigned to a worker, the next time they synchronize, their handheld computer will automatically reflect the changes that you have made. You can also send your workers data – for example, you can send work order information out to your mobile workforce in the morning, and they can synchronize the completed orders at the end of the day.

Data Integration Made Easy

Rely on FieldWorker to integrate data into your database quickly, easily and seamlessly. The FieldWorker standardized Application Program Interface (API) handles the creation, maintenance and management of data mapping between FieldWorker and any ODBC SQL or XML compliant database, including Oracle, MS SQL Server, IBM DB 2, Progress Sybase, and Access.

Two Pricing Models To Suit Your Needs

You don't have to be a Fortune 500 company to implement FieldWorker Enterprise. If you have a small number of mobile data collectors and can't afford an up front investment, try our **utility pricing** model – once your system is installed and running, you pay a monthly fee based on the number of people using the system. FieldWorker Support is included for customers on our utility pricing model – which means you'll get free upgrades and unlimited support as long as you're running FieldWorker. As you grow, our **site license pricing** model may make more sense – this model means you own the software, and you'll probably want to take advantage of our annual FieldWorker Support offering.

Speedy Implementation

We're sensitive to the time it takes an enterprise to implement and roll out a new business process. That's why we've developed standardized training and implementation processes that have resulted in an implementation of FieldWorker taking an average of just five days.

Full Knowledge Transfer

Once the implementation and training is complete – your staff will have a complete understanding of how to build and deploy applications, how to manage information and project deployment from the FieldWorker Administrator tool, and how to use our API to integrate your legacy systems using XML or ODBC compliant SQL. With FieldWorker Enterprise, you get the best of both worlds – a standardized software tool that you can use to run many applications, and the control you would normally have with a fully customized solution.

Proven ROI

FieldWorker Enterprise delivers a complete enterprise mobile data collection and synchronization solution at a fraction of the cost of other products. You save critical capital upfront and reduce support and expansion costs down the road. Rolling out your first enterprise wide FieldWorker application will give you an immediate ROI, and every subsequent FieldWorker application costs you next to nothing.
